SDEV-400 6380

Prof. Errol Waithe

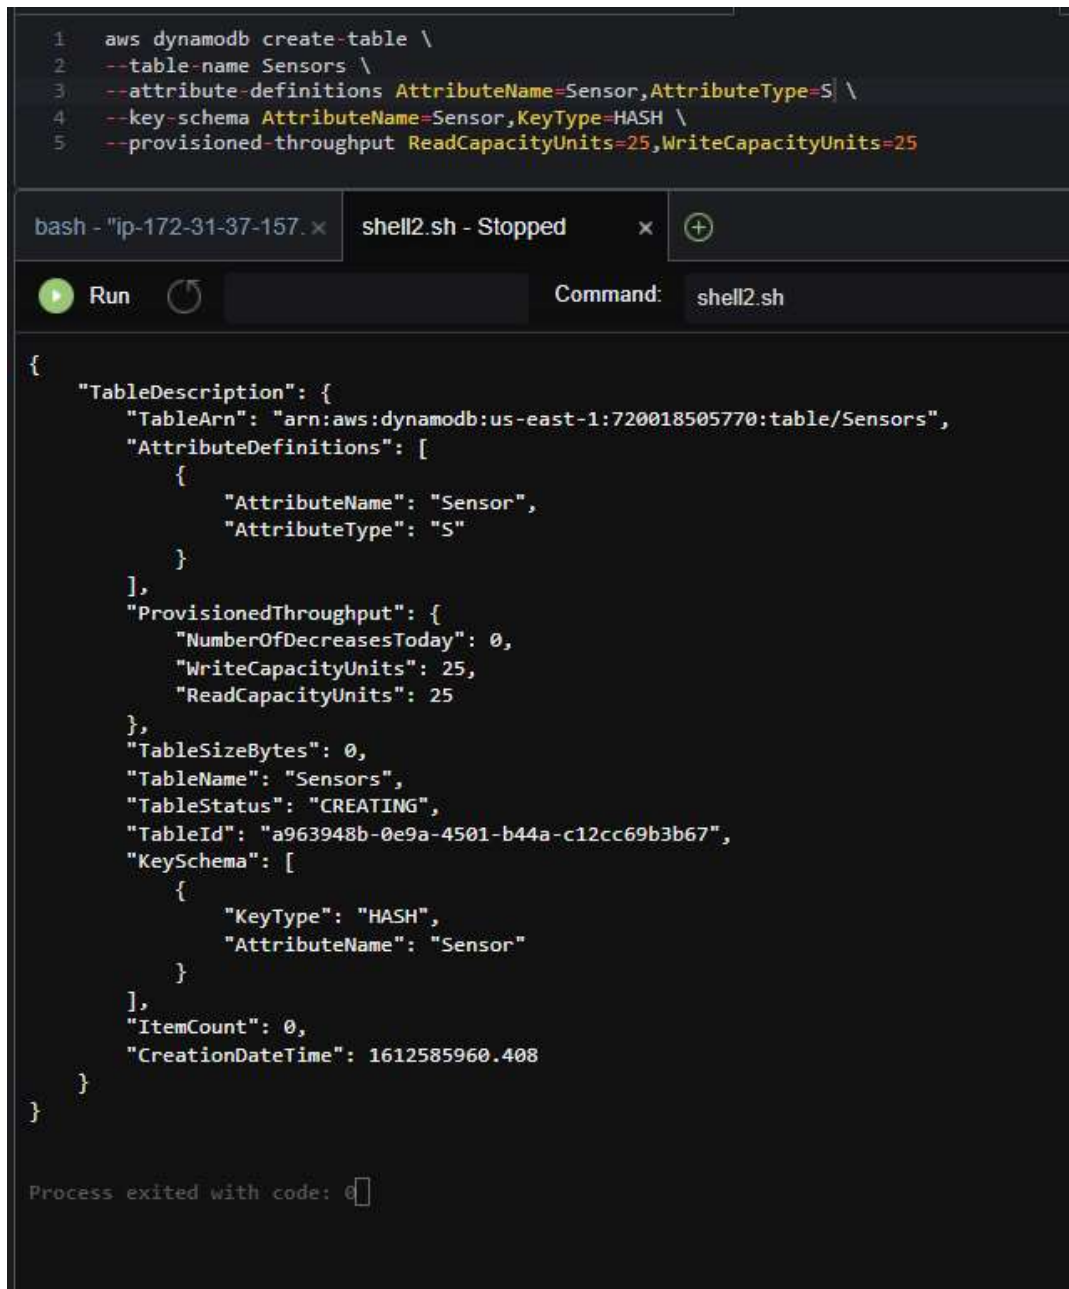

Homework2

Table of Contents for Test Cases

1. Creating the Sensor table
2. JSON file loading 20 sensor items
3. List sensors in Sensor table
4. Create a table named Classes
5. Executing the program
6. Delete tables from DynamoDB

1. Creating the Sensor table

Figure 1 shows the successful creation of the Sensor table using the create-table, with a Hash Key named Sensor and a read/write capacity of 25 items.

```
1 aws dynamodb create-table \
2 --table-name Sensors \
3 --attribute-definitions AttributeName=Sensor,AttributeType=S \
4 --key-schema AttributeName=Sensor,KeyType=HASH \
5 --provisioned-throughput ReadCapacityUnits=25,WriteCapacityUnits=25
```

bash - "ip-172-31-37-157. x" shell2.sh - Stopped x (+)

Run Command: shell2.sh

```
{
  "TableDescription": {
    "TableArn": "arn:aws:dynamodb:us-east-1:720018505770:table/Sensors",
    "AttributeDefinitions": [
      {
        "AttributeName": "Sensor",
        "AttributeType": "S"
      }
    ],
    "ProvisionedThroughput": {
      "NumberOfDecreasesToday": 0,
      "WriteCapacityUnits": 25,
      "ReadCapacityUnits": 25
    },
    "TableSizeBytes": 0,
    "TableName": "Sensors",
    "TableStatus": "CREATING",
    "TableId": "a963948b-0e9a-4501-b44a-c12cc69b3b67",
    "KeySchema": [
      {
        "KeyType": "HASH",
        "AttributeName": "Sensor"
      }
    ],
    "ItemCount": 0,
    "CreationDateTime": 1612585960.408
  }
}
```

Process exited with code: 0

Figure 1, Creating the Sensor table

2. JSON file loading 20 sensor items

Figure 2 shows the successful insertion of 20 different sensor items from a created JSON file.

```
vocstartsoft:~/environment $ aws dynamodb batch-write-item --request-items file://Sensors.json
{
  "UnprocessedItems": {}
}
```

Figure 2, successful execution of JSON file

3. List sensors in Sensor table

Figure 3 shows the successful scanning of the Sensor table when scan –table-name Sensors was executed.

```
vocstartsoft:~/environment $ aws dynamodb scan --table-name Sensors
{
  "Count": 20,
  "Items": [
    {
      "ImageFile": {
        "S": "/Sensors/images/fin.jpg"
      },
      "SensorDescription": {
        "S": "Finally"
      },
      "SampleRate": {
        "N": "65"
      },
      "Sensor": {
        "S": "Sensor20"
      },
      "Locations": {
        "L": [
          {
            "S": "Fallston, MD"
          },
          {
            "S": "Cam, PA"
          }
        ]
      }
    },
    {
      "ImageFile": {
        "S": "/Sensors/images/brady.jpg"
      },
      "SensorDescription": {
        "S": "Tom Brady"
      },
      "Sensor": {
        "S": "Sensor12"
      },
      "Locations": {
        "L": [
          {
            "S": "Tampa Bay, FL"
          }
        ]
      }
    }
  ]
}
```

Figure 3, Successful scanning of 20 items to sensor table

4. Create a table named Classes

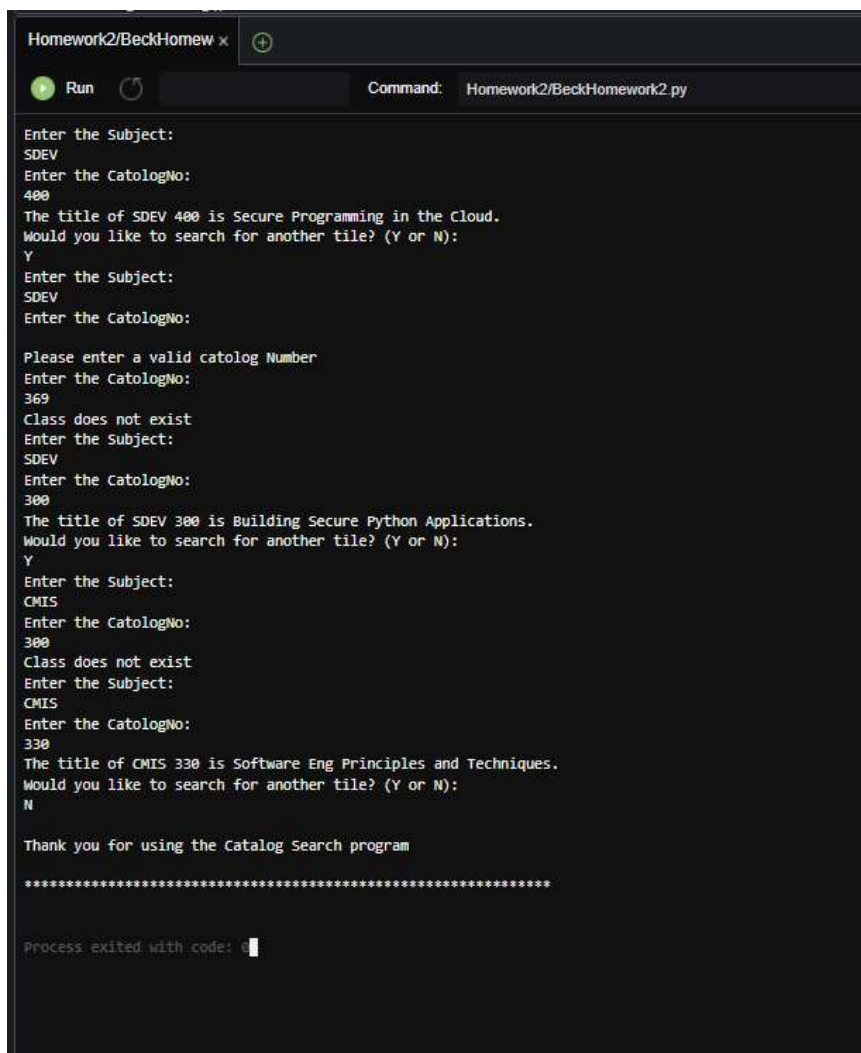

Figure 4 shows the function that creates a table named Classes (MoviesCreateTable.py).

```
def createTable():
    createdTable = dynamodb.create_table(
        TableName='Classes',
        KeySchema=[
            {
                'AttributeName': 'CourseID',
                'KeyType': 'HASH' #Partition key
            },
            {
                'AttributeName': 'Subject',
                'KeyType': 'RANGE' #Sort key
            }
        ],
        AttributeDefinitions=[
            {
                'AttributeName': 'CourseID',
                'AttributeType': 'N'
            },
            {
                'AttributeName': 'Subject',
                'AttributeType': 'S'
            }
        ],
        ProvisionedThroughput={
            'ReadCapacityUnits': 10,
            'WriteCapacityUnits': 10
        }
    )
    return createdTable
```

Figure 4, creating a table in python

5. Executing the program

Figure 5 shows the command line interface with various sample cases. If the user enters the information for a course in the catalog, the program will show the title of the course. If the user does not enter a subject or catalog number, the program will ask to enter one. If the user enters a class that does not exist, then the program will start back at the beginning. If the user selects that they would like to look for another course, then the program starts back at the beginning. If the user selects that they do not want to search for another title, then the program exits.

```
Homework2/BeckHomew x
Run Command: Homework2/BeckHomework2.py

Enter the Subject:
SDEV
Enter the CatalogNo:
400
The title of SDEV 400 is Secure Programming in the Cloud.
Would you like to search for another tile? (Y or N):
Y
Enter the Subject:
SDEV
Enter the CatalogNo:

Please enter a valid catalog Number
Enter the CatalogNo:
369
Class does not exist
Enter the Subject:
SDEV
Enter the CatalogNo:
300
The title of SDEV 300 is Building Secure Python Applications.
Would you like to search for another tile? (Y or N):
Y
Enter the Subject:
CMIS
Enter the CatalogNo:
300
Class does not exist
Enter the Subject:
CMIS
Enter the CatalogNo:
330
The title of CMIS 330 is Software Eng Principles and Techniques.
Would you like to search for another tile? (Y or N):
N

Thank you for using the Catalog Search program

6. Delete tables from DynamoDB

Figure 6 shows the tables, Sensors and Classes, before deletion. Figure 7 shows the delete-table command being used for both tables. Figure 8 shows the table that is left in DynamoDB after deletion.

Name	Status	Partition key	Sort key	Indexes	Total read capacity	Total write capacity
Classes	Active	CourseID (Number)	Subject (String)	0	10	10
Sensors	Active	Sensor (String)	-	0	25	25
Studentsv7	Active	email (String)	Lastname (String)	0	5	5

Figure 6, Tables in DynamoDB before deletion

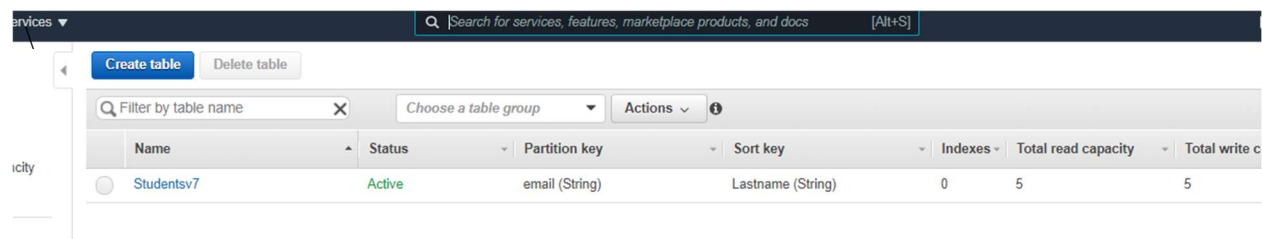

```
